

Oral health in children:

Hospital based dental extractions in Gloucestershire

The following report provides a snapshot of tooth extraction data in children aged 0-19 years in Gloucestershire.

Using hospital episode statistics (HES) data, this report uses the same methodology as the Office for Health Improvement and Disparities (OHID): <https://www.gov.uk/government/publications/analysis-of-tooth-extractions-in-hospital-methods-and-data-quality/methods-for-calculating-numbers-and-rates-of-hospital-tooth-extractions>

As this data only looks at hospital activity and does not include data from Community Dental Services, we can only use data to indicate trends and not as a reflection of need.

National Context

Extraction of teeth due to decay is the most common reason for hospital admissions for children aged 6 to 10.

- In 2022/23, there was a 17% increase in the number of episodes of caries-related tooth extractions in hospital for 0- to 19-year-olds (a reflection of a continued recovery of hospital services post Covid). In 2023/24, this decreased by 2%.
- The greater availability of data provides local authorities with the opportunity to explore trends in caries-related tooth extraction data.
- The caries-related tooth extraction rate for CYP living in the most deprived communities exceeds x3.5 that of those living in the most affluent communities.

In 2023/24,
there were
30,587 episodes
of caries-related
extractions

This is equivalent
to over 10 school
buses* full of
children each
week

The cost of caries-
related tooth
extractions cost the
NHS £45.7m in
2023/24

~60,000 school
days are missed
each year due to
hospital tooth
extractions

Despite this, dental decay is entirely preventable.

Notes and caveats

- The data source for these slides is Hospital Episodes Statistics (HES). For information about this data, please visit: <https://digital.nhs.uk/services/hospital-episode-statistics>.
- The methodology used to extract the data from HES follows the same method used in the [OHID Hospital-based tooth extractions in 0- to 19-year-olds analysis](#).
- The data is only an indicator of trends and only looks at hospital activity. It does not include data from community dental services where tooth extractions can also take place.
- As the data is for Gloucestershire hospital activity - it includes children who live in other counties who have received treatment in Gloucestershire. Conversely, the data does not include Gloucestershire resident children who have travelled over the Gloucestershire border for treatment.
- Inaccuracies may exist in the coding of diagnosis and procedure fields which can distort the data.
- There may be multiple episodes recorded for one patient, and this may be due to the anaesthetic used on the patient; some methods require more than one appointment to complete their treatment. There is no way to identify the anaesthetic type or to identify which patient has been included multiple times. Therefore, the data contains a higher number of finished consultant episodes (FCEs). For Gloucestershire, there are 16 cases where a second episode is recorded and 2 cases where a third episode is recorded.

Definitions:

Recorded dental extraction episodes due to:

- **All reasons:** Hospital admissions for teeth extractions due to any reason (including. teeth impaction, positioning and abnormalities) in children aged 0-19.
- **Decay:** Hospital admissions for teeth extractions where dental caries is the primary reason, in children aged 0-19.

ICD-10- The International Classification of Diseases 10th Revision is a catalogue used to code diseases and medical conditions.

The table on the right gives the ICD-10 diagnosis codes for all the reasons for extractions where more than 5 episodes have occurred, **highlighted in bold** are the decay reasons.

ICD-10 Category	ICD-10 Subcategory
Disorders of tooth development and eruption	K001 Supernumerary teeth
	K003 Mottled teeth
	K004 Disturbances in tooth formation
	K006 Disturbances in tooth eruption
	K008 Other specified disorders of tooth development
Embedded and impacted teeth	K009 Disorder of tooth development, unspecified
	K010 Embedded teeth
	K011 Impacted teeth
Dental caries	K020 Caries limited to enamel
	K021 Caries of dentine
	K025 Caries with pulp exposure
	K028 Other dental caries
Other diseases of hard tissues of teeth	K029 Dental caries, unspecified
	K035 Ankylosis of teeth
Diseases of pulp and periapical tissues	K040 Pulpitis
	K046 Periapical abscess with sinus
	K047 Periapical abscess without sinus
Gingivitis and periodontal diseases	K053 Chronic periodontitis
Dentofacial anomalies [including malocclusion]	K071 Anomalies of jaw-cranial base relationship
	K073 Anomalies of tooth position
	K074 Malocclusion, unspecified
Other disorders of teeth and supporting structures	K083 Retained dental root
	K088 Other specified disorders of teeth and supporting structures
	K089 Disorder of teeth and supporting structures, unspecified
Fracture of skull and facial bones	S0250 Fracture of tooth
Dislocation, sprain and strain of joint injuries and ligaments of head	S032 Dislocation of tooth

Number of extractions taking place in children aged 19 and under

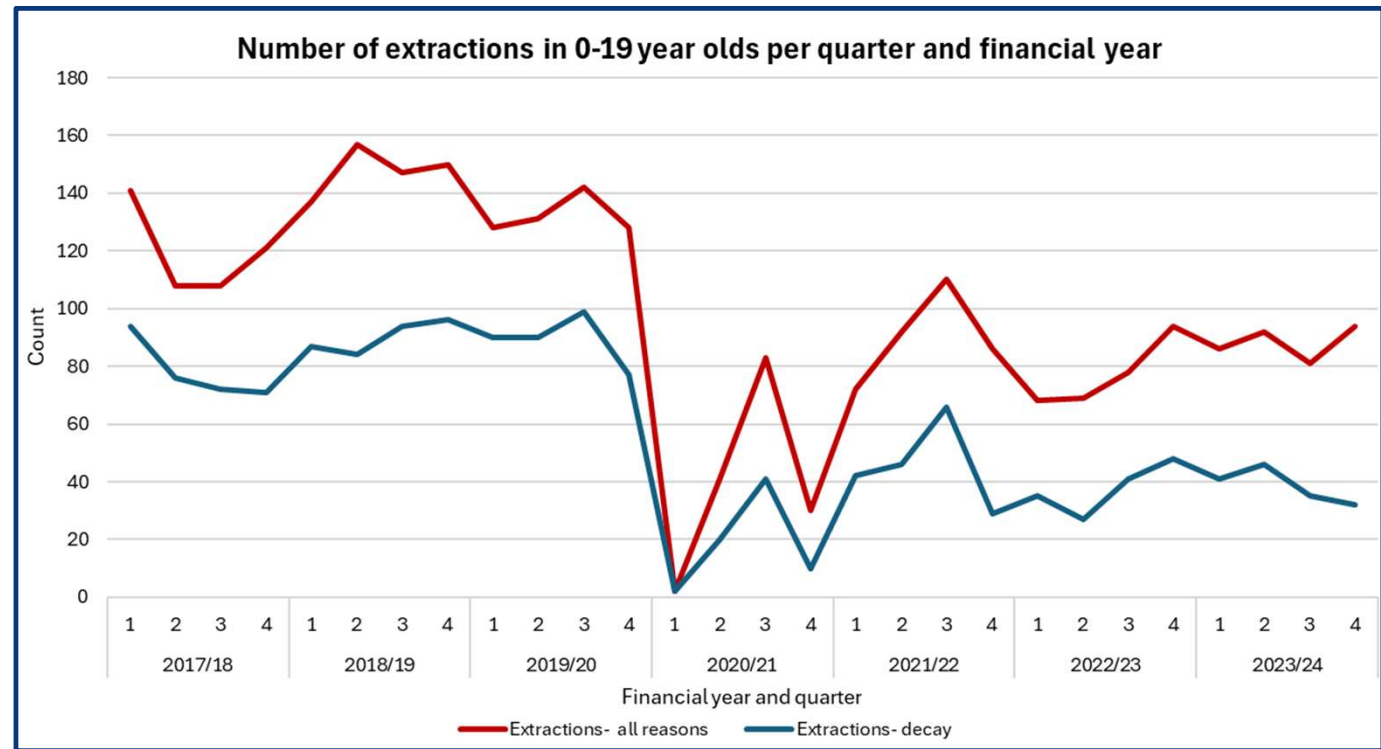

- There was **2,776** all reason extraction episodes occurring between April 2017 and March 2024.
- There was **1,591** extraction episodes for decay between April 2017 and March 2024.
- The percentage of all extraction episodes where decay was the primary reason ranged from **47%** to **67%**.

Data source: Hospital Episode Statistics

Number of extractions by financial year and quarter

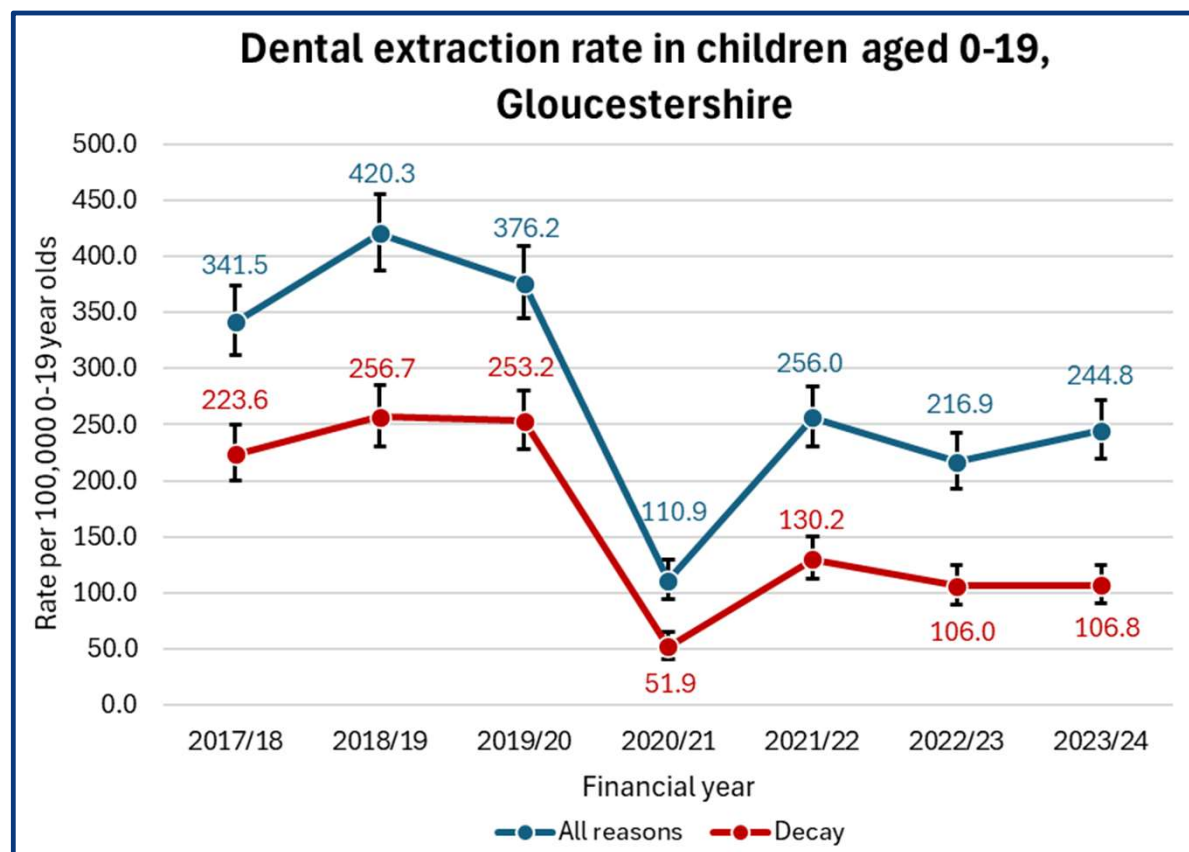

- The **impact of COVID** is clearly marked by the **steep decline** in extractions.
- The number of tooth extraction procedures are still lower than pre-pandemic levels.

Data source: Hospital Episode Statistics

Tooth extraction rate *Unstandardised rates

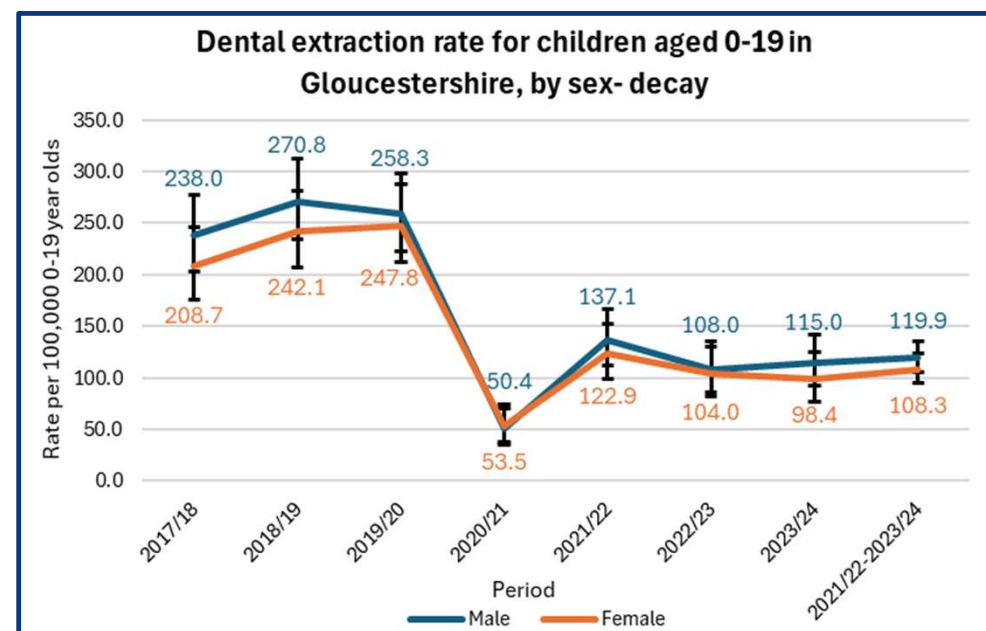

- In 2023/24, the rate of all reason extractions was **244.8** per 100,000 population and the rate for decay extractions was **106.8** per 100,000.
- There was a **significant decrease** in the extraction rates between 2019/20 and 2020/21, attributed to the COVID-19 pandemic.
- There was a **significant increase** in extractions between 2020/21 and 2021/22 and then a steady trend. The rate of extractions **remains significantly below** the years preceding covid.

Data sources: Hospital Episode Statistics, ONS Mid-year Population Estimates

Teeth extraction episodes by sex

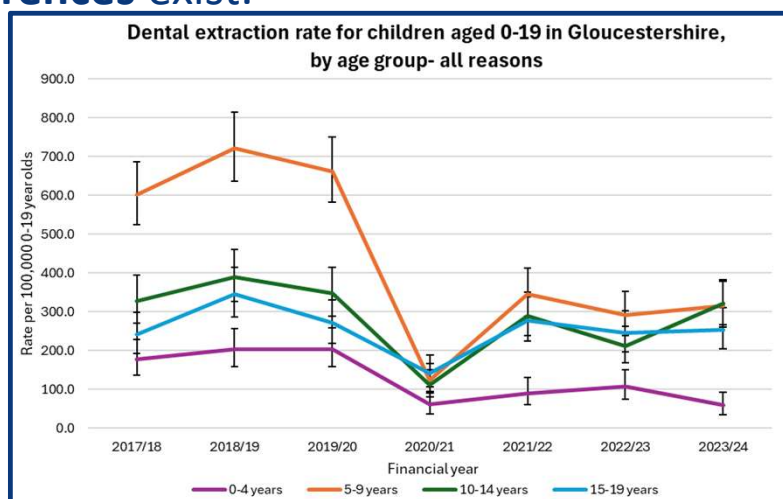

There were **no significant sex differences** in the rate of children who had teeth extractions for all reasons and for decay.

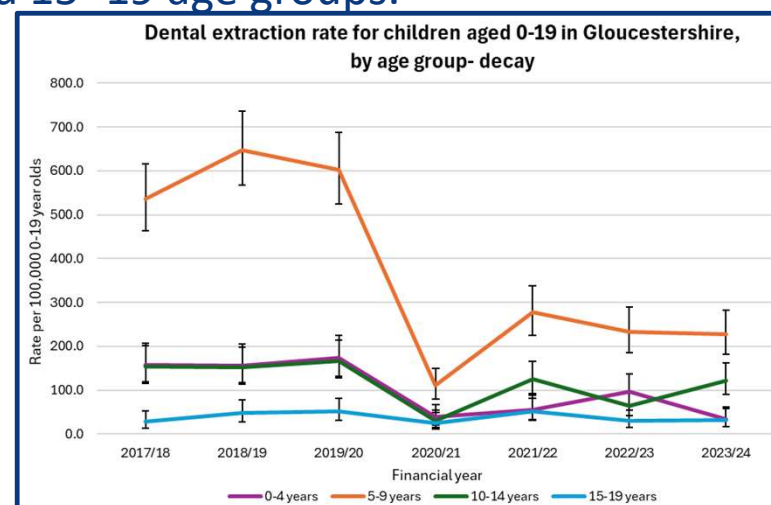

Data sources: Hospital Episode Statistics, , ONS Mid-year Population Estimates

Teeth extraction episodes by age group

Before 2020/21, children aged 5-9 had a **significantly higher** rate of all reason tooth extraction episodes compared to the other age groups. Since 2020/21, the rate among **children aged 0-4** has been **significantly lower** than the **other age groups**, among which **no significant differences** exist.

In all years, children aged 5-9 have consistently experienced **significantly higher** rates of tooth extractions for decay compared to other age groups. The rates for the **other age groups** have **fluctuated** over time. In 2023/24, the **10-14 age group** had a **significantly higher** rate of extractions than both the 0-4 and 15-19 age groups.

Data sources: Hospital Episode Statistics , ONS Mid-year Population Estimates

Tooth extractions by ethnicity- rate

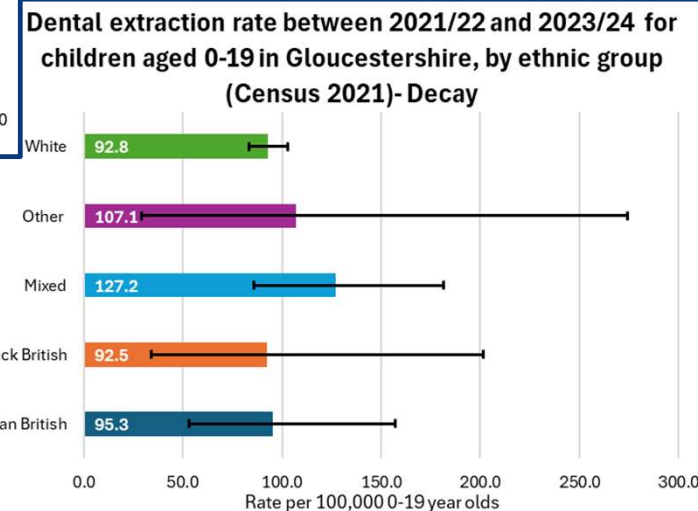

Where ethnicity is recorded, between 2021/22 to 2023/24, there were **no significant differences** in tooth extraction rates among children of different ethnicities, whether for all reasons or specifically for decay.

However, we need to be cautious when using this data due to the high number of cases without a recorded ethnicity, which isn't included in this analysis.

191/1022 (19%) all reason episodes where ethnicity is unknown.

88/488 (19%) decay episodes where ethnicity is unknown.

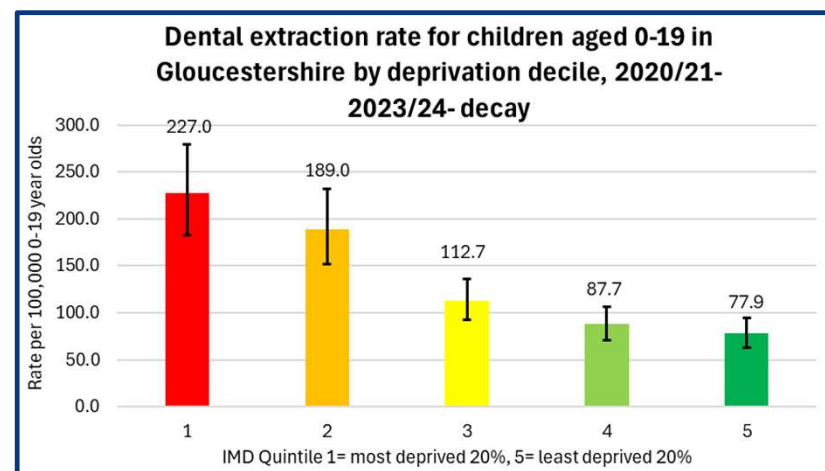

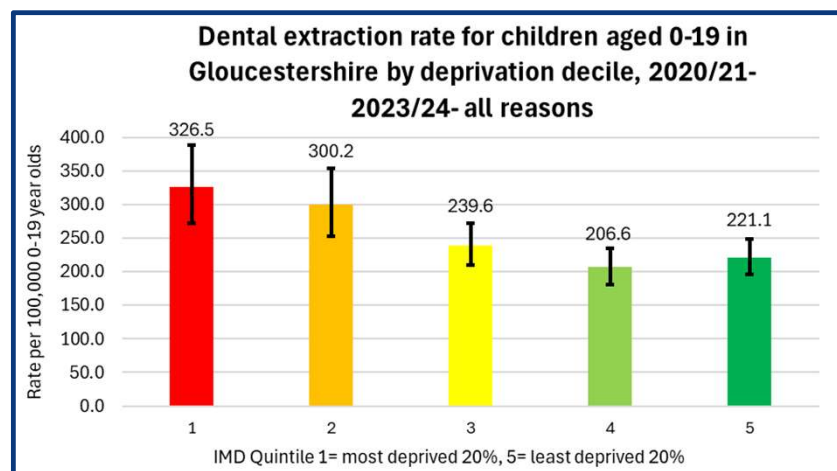

Data sources: Hospital Episode Statistics, ONS Census

Teeth extractions by deprivation

There is a clear link between deprivation and the rate of tooth extractions.

Children living in the **most deprived quintile nationally (1)** had a **significantly higher** rate of tooth extractions for all reasons compared to children living in **quintiles 3-5**. Children living in **quintile 2** also had a **significantly higher** rate of extractions than **quintiles 4 and 5**.

Children living in the national deprivation **quintiles 1 and 2** had **significantly higher** rates of decay-related tooth extractions compared to those living in the less deprived **quintiles 3-5**.

Data sources: Hospital Episode Statistics, MHCLG English Indices of Deprivation, ONS Mid-year Population Estimates

Episodes with multiple tooth extractions

A high proportion of procedures involved multiple teeth extractions in one episode:

- **65.3-73.3%** of procedures for all reasons
- **81.4-90.4%** of procedures for decay

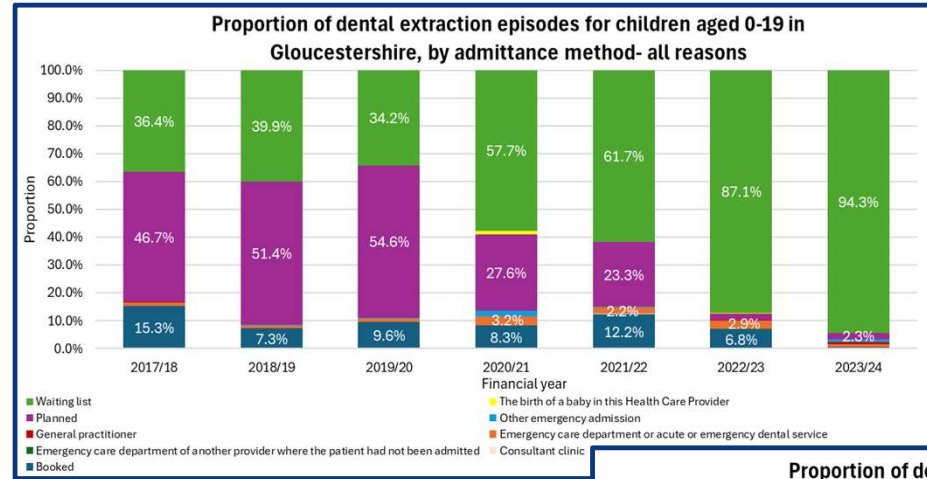

* Episodes with multiple tooth extraction episodes were identified using the operation codes, there is a chance that inconsistent codes have been assigned to the data.

Financial year	All reasons		Decay	
	Procedures with multiple teeth extracted	Proportion of total procedures	Procedures with multiple teeth extracted	Proportion of total procedures
2017/18	333	69.7%	281	89.8%
2018/19	408	69.0%	320	88.6%
2019/20	388	73.3%	322	90.4%
2020/21	109	69.9%	64	87.7%
2021/22	235	65.3%	149	81.4%
2022/23	203	65.7%	129	85.4%
2023/24	232	65.7%	131	85.1%

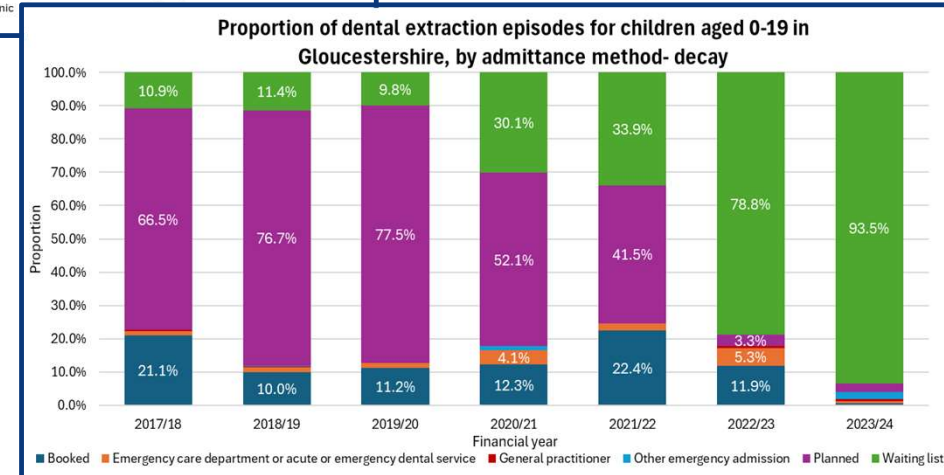

Data source: Hospital Episode Statistics

Admittance method for procedures

- Since the pandemic, there has been an **increasing proportion** of admittances coded as **waiting list**.
- The next highest admittance method was **planned**, and in 2023/24 it accounted for around **2%** of admittances.
- Emergency admissions account for a very small number of admissions (<10 a year)

Extractions by district- age-standardised rate per 100,000- all reasons

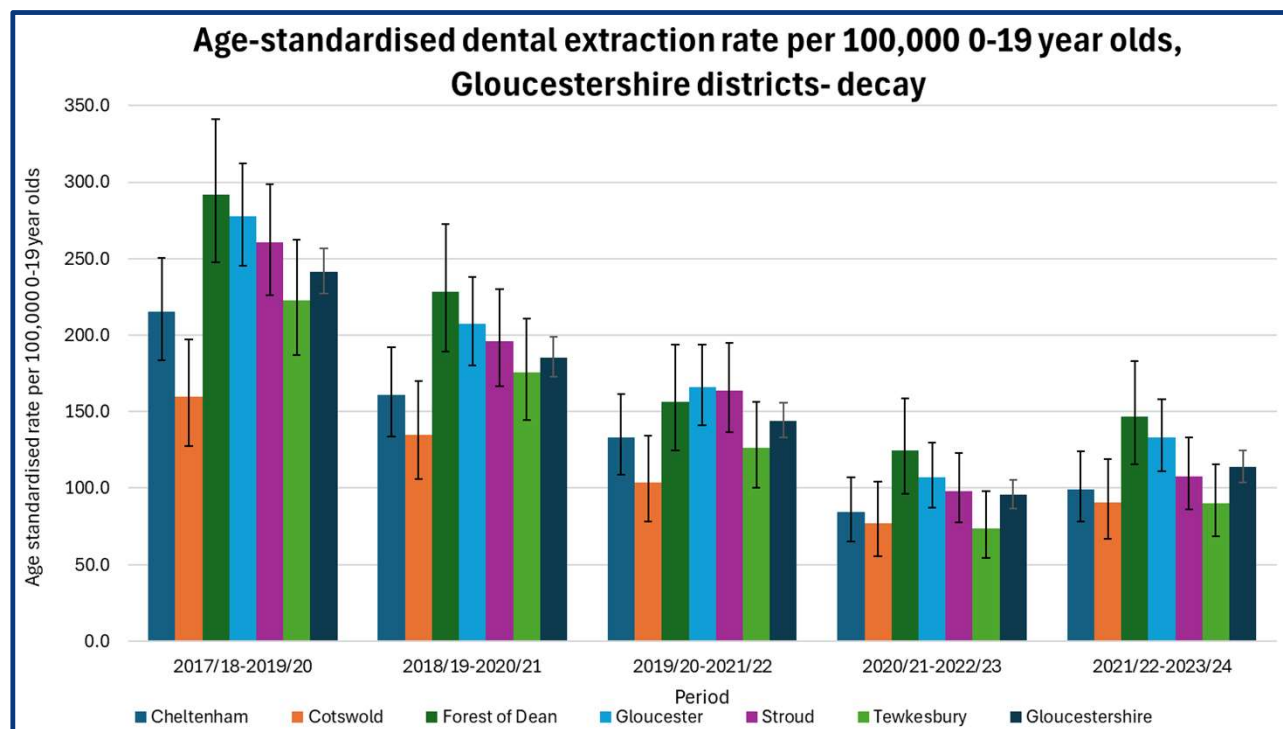

- In 2021/22 to 2023/24, **Forest of Dean** had the **highest rate** of age-standardised admissions, with **272.7** extractions per 100,000 population.
- However, the rate was **only statistically significantly higher** than **Cheltenham** and **Tewkesbury**.
- Whilst there has been some fluctuation in the high to low order of district rates. **Forest of Dean, Gloucester and Stroud** consistently stand out as having the **highest all reason extraction rate** in each period.

Data sources: Hospital Episode Statistics, ONS Mid-year Population Estimates

Extractions by district- age-standardised rate per 100,000- decay

- In 2021/22 to 2023/24, **Forest of Dean** had the **highest rate** of age-standardised admissions, with **146.6** extractions per 100,000 population.
- However, the rate was **only statistically significantly higher** than **Tewkesbury**.
- Whilst there has been some fluctuation in the high to low order of district rates. **Forest of Dean, Gloucester and Stroud** consistently stand out as having the **highest decay extraction rate** in each period.
