

Priority Species List

Gloucestershire Local Nature Recovery Strategy

Priority Species List for Gloucestershire Local Nature Recovery Strategy 2026

The Priority Species list comprises rare and threatened species that are considered a priority within Gloucestershire. The main Priority Species List shows the Priority Species in taxonomic order and each habitat or species group that the species has been placed in. The other lists show each of the Groups and list the species that should benefit from managing or creating that habitat, or implementing the relevant Species Potential Measure.

Table 1 - Species assemblages

Group name	Habitat group or Species measure	Number of species in the group
Acid grass and heath	Habitat	38
Arable birds	Species measure	24
Arable species	Species measure	30

The Local Nature Recovery Strategy species task and finish group

The group comprised representatives from Gloucestershire Centre for Environmental Records and ecology experts in Gloucestershire. The group was convened to develop a long list of rare and threatened species in Gloucestershire, and to shortlist priority individual species and species groups for specific species priorities and potential measures. The long list of rare and threatened species were also grouped in relation to the habitat priorities and measures that can contribute to their conservation and recovery.

The species task and finish group included experts from Cotswolds National Landscape, Butterfly Conservation, Natural England, Gloucestershire County Council, Environment Agency, Gloucestershire Naturalists Society and independent ecologists. A wider set of county recorders and specialists from Gloucestershire Naturalists Society and other members of the Nature Recovery working group helped to refine the long-list and short-list development and information. Gloucestershire Centre for Environmental Records (GCER) played a key role in coordinating and managing this information and process.

Priority Species List process

The guidance *Species Recovery within Local Nature Recovery Strategies, Advice for Responsible Authorities, August 2023* (not available publicly), asked Local Nature Recovery Strategies to create a list of rare and threatened species in Gloucestershire, and then to identify species or groups of species which would need additional actions beyond the habitat Potential Measures, for specific species Potential Measures.

To create the Gloucestershire Priority Species List, the start point was species Red List data from *NERR124 Edition 1. OIF D5 Conservation status of our native species Data Sheet 2022*, using the criteria of species which have been assigned to Vulnerable (VU), Endangered (EN), or Critically Endangered (CR) categories in approved

GB IUCN Red Lists. GCER staff also included extinct and regionally extinct species and near threatened species, though this was not indicated in the original advice document. This list was then used to search the GCER Gloucestershire database to create a specific Gloucestershire list.

This spreadsheet was the main focus of discussion at a meeting in October 2023 combining the Nature Recovery working group with a range of county species experts including county recorders, Gloucestershire Naturalists Society members, Gloucestershire Centre for Environmental Records, Butterfly Conservation and British Trust for Ornithology. Following the consultation meeting, a LNRS Species Task and Finish group was created.

At the first meeting of the LNRS Species task and finish group it was decided to extend the list to all Biodiversity Action Plan (BAP) 2007, England Natural Environment Rural Communities Act (NERC), Schedule 41 and Birds of Conservation Concern (BOCC) Red and Amber list species. The new list was generated using the Joint Nature Conservation Committee (JNCC) taxon designations 20230404 spreadsheet using BAP/NERC and Red and Amber list bird species as criteria. This new list was again used to search the GCER Gloucestershire database to create a specific Gloucestershire list.

The list was divided by taxa and a member of the task and finish group was assigned at least one taxon. The taxon lead shared the initial list with the appropriate county recorders and other organisations for their opinions and additions to the list. Consulted organisations included Gloucestershire Naturalists Society, Cotswold National Landscape, Environment Agency, RSPB, Butterfly Conservation, Buglife, Peoples Trust for Endangered Species, British and Irish Conchological Society as well as national recording schemes. Taxon leads also used literature relating to the species within Gloucestershire to determine if the species was noted as threatened or iconic in Gloucestershire. Many taxa were underrepresented on the list, such as fungi, lichens and invertebrates so a large number of these species were added via consultation with local and national experts.

There are 580 rare and threatened species in Gloucestershire on the 2025 Gloucestershire Priority Species List. The following justifications for inclusions were used:

- On the OIF D5 Conservation status of our native species Data Sheet 2022 as Vulnerable, Endangered, or Critically Endangered, Extinct and Regionally Extinct species and Near Threatened species
- BAP 2007, England NERC S.41 and Bird Red and Amber list species
- County expert recommended the inclusion
- Conservation organisation or national recording scheme recommended the inclusion

Justification for exclusion:

- Deemed to be an escapee, vagrant or invasive non-native species
- County expert recommended the exclusion
- Conservation organisation or national recording scheme recommended the exclusion

Grouping the Priority Species List into habitat groups

Where possible the species were put into habitat groups that require similar management measures. Each species can be in multiple groups as it was important to consider each life stage, including breeding and

overwintering requirement. The management needs of these species were considered when the Potential Measures for the habitats were written.

For species or assemblages that require extra management actions beyond those that appear in the habitat measures, Species Potential Measures were developed, with the help of the LNRS species task and finish group, most of which have a mapped zone for where these actions should be focused.

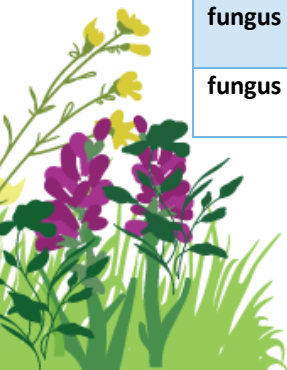

To support the creation of the habitat groups for species, each species on the Priority Species list was assigned at least one UKHabs code, with up to five codes per species to account for various needs related to breeding, migration, wintering, and different life stages. This process was carried out by the taxon leads and county experts, in collaboration with the taxon lead. Invertebrate taxon leads also utilised Buglife's pantheon software to assign habitats.

This resulted in a list for each key habitat, of the rare and threatened species in Gloucestershire that could benefit from actions to manage, restore and create that habitat. These habitat-specific species lists can be found in the Potential Measures documents available through the Local Habitat Map, as well as in this Priority Species List document.
